UNISWAP: A DECENTRALIZED FINANCE
PROTOCOL.

THE FUTURE OF WEB3 ECOSYSTEMS

# Uniswap

Gitcoin grants round 12, 2021.

PROJECT SUBMISSION ABSTRACT

# THE UNISHOP

My grant submission for the Uniswap *Innovations* grant offers a yet unrealized use of web3. This presentation will detail a dApp that I believe has great future potential.

The Unishop is a reseller dApp functioning on web3 utilizing uniswap's protocol and layer-2 solutions reducing gas-fees and allowing for user-friendly multi-token use.

Similar to the dApp Opensea, Unishop sellers would post NFTs linked to a physical item which they process and ship after the transaction has been approved. A combination of Uniswap's protocol and Polygon's Ethereum side-chain reduces gas-fees making this type of NFT marketplace the first of its kind.

I believe attaching physical value to an NFT on a verifiable, secure decentralized platform will help the general public comprehend the versatility of an NFT, expanding on the common base understanding of NFTs beyond something that's exclusively a jpeg.
